

Environmental Guidelines Maderas Holztechnik GmbH

1. Environmental protection and resource conservation is an important corporate goal for us. We are committed to our responsibility to the environment and see it as a commitment to us and to the future generations to come.
2. Our products are almost 100% solid wood. When using the raw material, we make sure that the wood comes from sustainable and responsible forest management. In order to promote this forestry and to document the uninterrupted supply chain of this wood, we are PEFC and FSC certified.
3. We treat our resources and materials with care. This includes the use of technologies and production processes that enable the lowest possible use of materials and energy. We cover part of our electricity demand with our own photovoltaic system. Our company halls are 100% heated with their own wood residues.
4. We involve our employees in environmental protection issues in order to actively improve environmental protection in the company. We inform employees about environmental issues and train them in this field. The environmental guidelines are binding for all employees in all processes and activities. To implement and organise environmental protection in the company, we participate in ECOPROFIT project.
5. The prevention, recovery and reduction of waste has priority over disposal. This principle is observed in all production processes. We recover waste through a professional disposal or recyclable material collection company.
6. It is important for us to recognize risks for humans and the environment at an early stage in order to avoid accidents and operational incidents.
7. Compliance with legal regulations and regulatory requirements is a matter of course for us.
